Title : Tuberculosis Health Centre Design with Biophilic
Architecture Approach in Cikoko, Jakarta

This paper is a part of Architecture final project in Agung Podomoro University. The application of biophilic design to achieve holistic healing in the Tuberculosis (TBC) Health Centre is a medical facility with a biophilic concept to create interaction between humans and the environment and their surroundings and can help the process of physical and psychic healing (holistic healing) patients and their workers. One way to help a patient recover can be by means of a basic healing from nature itself. Not only from medicines medically or treatments performed but also from nature. The application of Biophilic design suggests that patients can continue to perform both human and natural interactions and this reduce anxiety, stress, depression in patients who need more serious treatment or those in special rooms (such as TBC patients in isolation). By applying biophilic architecture approach in TBC Health Centre design hopefully can help patients achieve holistic healing.

Keywords: Biophilic, Health Centre, Holistic Healing, Tuberculosis (TBC).
